SauceDemo Manual Testing Project

1. Project Overview

This project demonstrates manual software testing of the SauceDemo e-commerce web application. It focuses on validating the shopping workflow, checkout form validations, cart behavior, and order completion process.

Project Type: Manual Software Quality Assurance (SQA)
Application: SauceDemo
Testing Approach: Black-box manual testing
Tools: Google Sheets, Microsoft Excel, Web Browser, GitHub
Tester: Warisha Fiaz

2. Project Objectives

- Verify checkout form validation for required fields.
- Validate checkout navigation and overview information.
- Examine shopping cart contents and price calculations.
- Record actual results and compare them with expected results.
- Document potential defects and maintain traceability between requirements and test cases.

3. Scope of Testing

In Scope

- Checkout required-field validation
- Valid checkout information
- Checkout overview sections
- Empty-cart price summary
- Order confirmation behavior
- Post-checkout navigation
- Cart badge and cart contents

Out of Scope

- Automated testing
- Performance and load testing
- Security testing

- Cross-browser compatibility testing

4. Testing Artifacts

The project contains a manual testing workbook with the following sheets:

Artifact	Purpose
Requirements Traceability Matrix (RTM)	Maps requirements to related test cases
Test Cases	Documents scenarios, steps, expected results, actual results, and status
Execution Results	Records test execution outcomes
Defect Report	Documents potential defects for further investigation
Test Data	Records input values and corresponding results

5. Key Test Scenarios

- Submitting checkout with all required fields blank
- Submitting checkout with a missing Last Name
- Submitting checkout with a missing Postal Code
- Continuing checkout with valid information
- Verifying payment, shipping, and price summary sections
- Checking the price summary when the cart is empty
- Investigating order completion with an empty cart
- Verifying post-checkout navigation and cart contents

6. Defect Observation

Observation: The application displayed an order confirmation after checkout was completed with an empty cart.

Status: Needs Verification

This behavior has been documented as a potential defect. Further verification against the application's expected requirements is necessary before classifying it as a confirmed defect.

7. Evidence

The `Test-Evidence` folder contains screenshots captured during testing. These screenshots support the documented test scenarios and observed application behavior.

8. Project Outcome

This project demonstrates practical experience in manual test case design, test execution, requirements traceability, test data preparation, defect documentation, and evidence collection.

9. Future Improvements

- Expand coverage to product listing, sorting, product details, and cart operations.
- Add additional negative and boundary test scenarios.
- Review and verify potential defects.
- Improve traceability and execution reporting.
- Explore automation after completing the manual testing portfolio.

10. Disclaimer

This project is intended for educational and portfolio purposes. Test outcomes reflect the behavior observed during the documented test runs.
